                                                                                                                                   The invention relates to a method of modulation of expression of a DNA molecule (preferably inhibition of lipogenesis or glycolysis) that encodes a protein involved in glucose metabolism or lipogenesis in a cel which comprises contacting the cell with an agent that induces phosphorylation or dephosphorylation of carbohydrate response element binding protein (ChREBP). The method is useful for treating obesity, diabetes or vascular disease and modulating carbohydrate metabolism, for inhibiting lipogenesis or glycolysis and modulating expression of a DNA molecule that encodes a protein involved in glucose metabolism or lipogenesis in a cell (e.g. human liver cell) and for treating cardiac disease. The present sequence represents an oligonucleotide used in the purification of ChREBP
                                                                                                             Sequence

                                                                                                                                                                                                                                                                                                                                                              molecule (preferably inhibition of lipogenesis or glycolysis) that encodes a protein involved in glucose metabolism or lipogenesis in a ce which comprises contacting the cell with an agent that induces phosphorylation or carbohydrate response element binding protein (ChREBP). The method is useful for treating obesity, diabetes or vascular disease and modulating carbohydrate metabolism, fo inhibiting lipogenesis or glycolysis and modulating expression of a DNA molecule that encodes a protein involved in glucose metabolism or lipogenesis in a cell (e.g. human liver cell) and for treating cardiac disease. The present sequence represents a L-pyruvate kinase carbohydra

The present sequence represents a L-pyruvate kinase carbohydrate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a method of modulation of expression of a DNA molecule (preferably inhibition of lipogenesis or glycolysis) that encodes a protein involved in glucose metabolism or lipogenesis in a cwhich comprises contacting the cell with an agent that induces phosphorylation or dephosphorylation of carbohydrate response element binding protein (Chreb). The method is useful for treating obesity,

                                                                                                                                                                                                                                                                                                            The invention relates to a method of modulation of expression of a DNA molecule (preferably inhibition of lipogenesis or glycolygis) that encodes a protein involved in glucose metabolism or lipogenesis in a cell which comprises contacting the cell with an agent that induces phosphorylation or dephosphorylation of carbohydrate response element binding protein (chREBP). The method is useful for treating obesity, diabetes or vascular disease and modulating carbohydrate metabolism, for inhibiting lipogenesis or glycolygis and modulating expression of a DNA molecule that encodes a protein involved in glucose metabolism or lipogenesis in a cell (e.g. human liver cell) and for treating cardiac disease. The present sequence represents a ChREBP gel shift assay gene

NOTE: This is a 'working draft' sequence. It currently consists of 63 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         as soon as it is available and the accession number will be preserved.

   On Apr 12, 2002 this sequence version replaced gi:19847866.
   During sequence assembly data is compared from overlapping clones.
   Where differences are found these are annotated as variations
   together with a note of the overlapping clone name. Note that the
   variation annotation may not be found in the sequence submission
   corresponding to the overlapping clone, as we submit sequences with
   only a small overlap as described above.

This sequence was finished as follows unless otherwise noted: all
   regions were either double-stranded or sequenced with an alternate
   chemistry or covered by high quality data (i.e., phred quality >=
   30); an attempt was made to resolve all sequencing problems, such
   as compressions and repeats; all regions were covered by at least
   one plasmid subclone or more than one M13 subclone; and the
   assembly was confirmed by restriction digest. The following
   abbreviations are used to associate primary accession numbers given
   in the feature table with their source databases: Em:, EMBL; Sw:,
   SWISSPROT; Tr:, TREMBL; Mp:, WORMPEP; Information on the WORMPEP

Consortium/LLNL at: http://image.llnl.gov
Series: IRAK Plate: 18 Row: i Column: 20
This clone was selected for full length sequencing because it
passed the following selection criteria: Hexamer frequency ORF
analysis, Similarity but not identity to protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               http://www.systemsbiology.org

(CACTGTGTGTG); lst = 1: DraIII (CACCATGTG); lst = 1: DraIII alpha was primed with an oligo(dT) primer
[ATGTGGCCTTTTTTTTTTTTTTTT]; double-stranded cDNA was
ligated to a DraIII adaptor [TGTTGGCCTACTGG], digested
and cloned into distinct DraIII sites of the pME18S-FL3
vector (5' site CACTGTGTG, 3' site CACCATGTG). XhoI should
be used to isolate the cDNA insert. Size selection was
performed to exclude fragments <1.5kb. Library
constructed by Dr. Sumio Sugano (University of Tokyo
Institute of Medical Science). Custom primers for
sequencing: 5' end primer CTCTGCTCTAAAAGCTGCG and 3' end
primer CGACCTGCAGCTCGAGCACA."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               /clone lib="Sugano mouse liver mila"
/note="Organ: liver; Vector: pMEIBS-FH3; Site 1: DraIII
(CACCTGTGTG); Site 2: DraIII (CACCATGTG); 1st strand cDNA
was primed with an oligo(dT) primer
[ATGTGGCCTTTTTTTTTTTTTTTTT]; double-stranded cDNA was
ligated to a DraIII adaptor [TGTTGGCCTACTGG], digested
and cloned into distinct DraIII sites of the pMEIBS-FH3
vector (5' site CACTGTGTG, 3' site CACCATGTG). XhoI should
be used to isolate the cDNA insert. Size selection was
performed to exclude fragments <1.5kb. Library
constructed by Dr. Sumio Sugano (University of Tokyo
Institute of Medical Science). Custom primers for
sequencing: 5' end primer CTTCTGCTCTAAAAGCTGCG and 3' end
primer CGACCTGCAGCTCGAGCACA."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          /clone_lib="Sugano mouse liver mlia"
//clone_lib="Sugano mouse liver mlia"
//note="Organ: liver; Vector: pME185-FL3; Site 1: Draili (CACCATGTG); lst strand cDNA
(CACTGTGTG); Site 2: Draili (CACCATGTG); lst strand cDNA
was primed with an oligo(dT) primer
[ATCTGGCCTTTTTTTTTTTTTTTT]; double-stranded cDNA was
ligated to a Draili adaptor [TGTTGGCCTACTGG], digested
and cloned into distinct Draili sites of the pME185-FL3
vector (5' site CACTGTGTG, 3' site CACCATGTG). XhoI should
be used to isolate the cDNA insert. Size selection was
performed to exclude fragments <1.5kb. Library
constructed by Dr. Sumio Sugano (University of Tokyo
Institute of Medical Science). Custom primers for
sequencing: 5' end primer CTTCTGCTCTAAAAGCTGCG and 3' end
primer CGACCTGCAGCTCGAGCACA."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               /Clone_lib="Sugano mouse liver mlia"
//Clone_lib="Sugano mouse liver mlia"
//Clone_Torgan: liver; Vector: pwEl8S-FL3; Site_1: DraIII
(CACTGTGTG); Site_2: DraIII (CACCATGTG); 1st strand cDNA
was primed with an oligo(dT) primer
{ATCTGGCCTTTTTTTTTTTTTTTTTTT]; double-stranded cDNA was
ligated to a DraIII adaptor [TGTTGGCCTACTGG], digested
and cloned into distinct DraIII sites of the pwEl8S-FL3
vector (5' site CACTGTGTG, 3' site CACCATGTG). XhoI should
be used to isolate the cDNA insert. Size selection was
performed to exclude fragments <1.5kb. Library
constructed by Dr. Sumio Sugano (University of Tokyo
Institute of Medical Science). Custom primers for
sequencing: 5' end primer CTTCTGCTCTAAAAGCTGCG and 3' end
primer CGACCTGCAGCTCGAGCACA."
